

## Synology® Unveils DiskStation Manager 3.2 Beta

### Forward-thinking NAS OS elevates efficiency, integrates new technologies, enriches user experience, and is now available for free download

Taipei, Taiwan—July 20, 2011—Synology® today announced the beta availability of DiskStation Manager (DSM) 3.2. The new NAS server OS has taken exciting steps in elevating:

- **Management efficiency** with centralized directory service, system-logs, CIFS share folders, and ISO images to mount as virtual drives
- **Business' mobility** with web-based DSM mobile and Google Cloud Print™ support
- **Digital entertainment** with new Photo Station 5 and enhanced Download Station
- **Mac compatibility** by supporting the latest Mac® OS X Lion and running Surveillance Station with Safari® Browser
- **User experience** with revamped Package Center, added HTML5 features, refreshed CSS3 style, and quick volume creation in Synology Hybrid RAID

"DSM 3.2 delivers an array of business applications, and realizes the way businesses would work in the future," said Rosiel Lee, product manager of Synology Inc. "Our industry-first comprehensive directory solutions are examples, which effortlessly integrate numerous user accounts in an existing IT infrastructure," Lee added. Supporting LDAP-based directory services, Synology NAS servers seamlessly fit into an existing Mac or Linux environment. For businesses that need to centralize account management from multiple servers, it takes only one click before Synology Directory Server package deploys directory infrastructure for them.

DSM 3.2 also excels at centralizing various resources. Syslog Server collects and stores logs aggregated from various servers, routers, and syslog-enabled devices for easy management. Message filtering, sorting, and flexible search criteria facilitate system log search. Remote Folder centralizes distributed CIFS files sharing, which allows business to build a single access portal for multiple servers for easy data accessing. Furthermore, distributed ISO files can be mounted onto a Synology NAS server with the Virtual Drive feature and can be played right away.

Spotting a surging trend of using smart phones and tablets as computing platforms for business, Synology leads the NAS industry with DSM mobile and Google Cloud Print support. With DSM mobile, IT administrators can swipe across their handheld devices to manage accounts and privileges, turn on or off services, and quickly access mobile apps. Synology boasts the most complete and competitive print server. In addition to AirPrint and multifunction printer support, Google Cloud Print support allows users to print documents remotely on their mobile devices without any hassle of driver installation.

DSM 3.2 enriches users' digital entertainment life. Featuring a revamped UI, Photo Station 5 provides a customizable theme designer and new mechanisms to speed up thumbnail creation. Synchronizing photos on designated Facebook's albums requires only one button click. Password protection to individual album is now supported. In addition, Download Station supports the most popular file hosting sites and even realizes Youtube download.

Synology is the first NAS server to support the latest Mac OS X Lion, ready to serve as a backup destination for Time Machine. In addition, Surveillance Station has taken the lead by operating on Safari 5. It is also optimized for rapid large scale deployment, by allowing for camera grouping and batch editing, supporting common privilege profile, as well as ensuring ONVIF compatibility.

DSM 3.2 creates an even more intuitive user experience by offering a revamped Package Center, which automatically collects and displays a variety of applications on a snappy UI. "User will love this new and convenient way to discover, install, and update their favorite applications in DSM. They can even choose to get email or desktop notifications whenever there are new packages and updates," Lee added. Another user-centric feature is the latest HTML5 feature and CSS3 style support. Drag-n-drop features are available on Download Station and File Browser for torrent opening and file upload from desktop. Furthermore, making volume ready for use with Synology Hybrid RAID is 95% faster than before. Users can store, edit, or move files around with minimal initial setup time.
